This is a true gem! My girlfriend has a radio-controlled digital clock, that not only DOESNT SHOW THE RIGHT TIME - oh no - it also actually STOPPED at 21:18'50 like it was just another ordinary analog clock. I have often seen digital clocks be wrong for some minutes or stop displaying time when the battery dies, but actually stopping? That is a new one :D Well not actually new, because it did stop before one time already and i couldnt believe it, so i changed the battery and it ran normally and accurately for about a week and then "crashed" again. It's like the watch is running a strange version of Windows for Clocks that just didnt come with a blue-screen, but instead just crashes randomly, hahahaha. And there i was thinking i had seen it all. Only time will tell, if i ever will get that feeling back... ..or perhaps not, because time decided to stop again :D
